

## How to update your Outgoing Mail Server (SMTP) - Mozilla Thunderbird 1.0.5

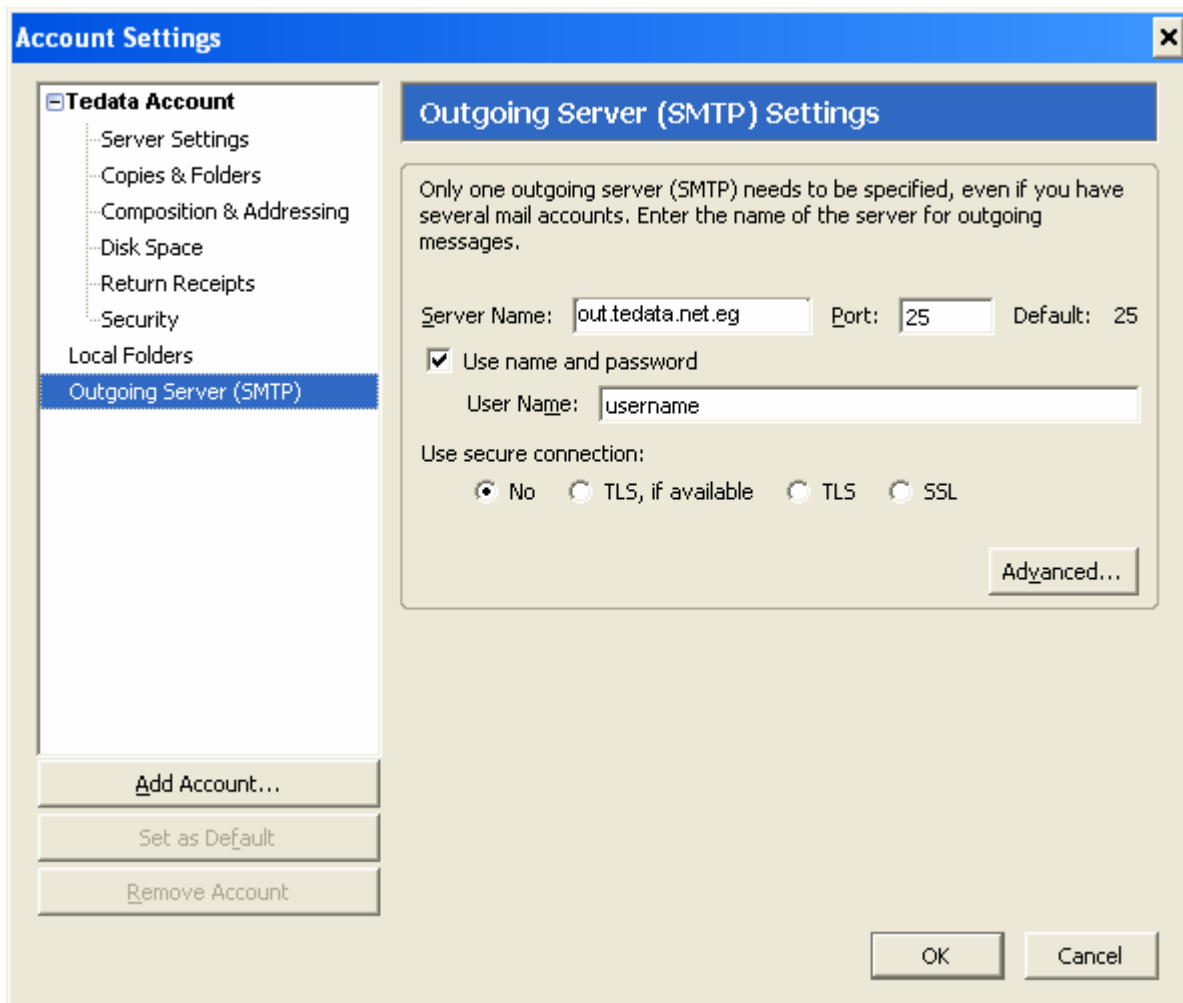

Follow this tutorial **if you can receive your email but cannot send mail**.

Use it as well to simply **make sure your email program is configured optimally**.

1 - Open Thunderbird, go to the **Tools** menu and choose **Account Settings**

2 - Click on the **Outgoing Server (SMTP)** category on the left column, and you should see this screen:

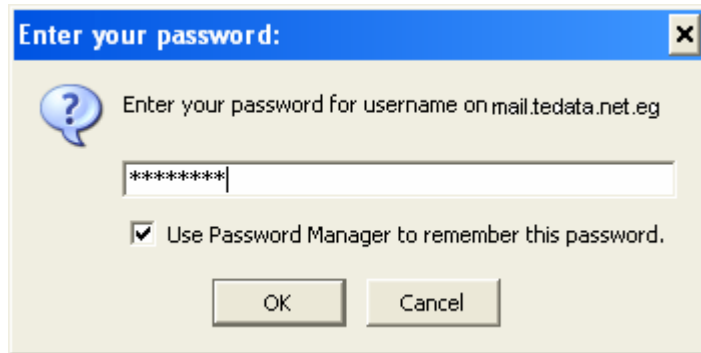

Make sure the **Server Name** says **out.tedata.net.eg**.  
**Port** should be left to **25** (the default setting).

**Check** the box that says **Use name and password**, and in the **User Name** box, type in your tedata username (most likely, it will be the first part of your tedata email address, for example *useraneme* is your email address is *username@tedata..net*).

Under **Use secure connection**, select the radio button called **No**.

Click **OK** to confirm your changes

3 - Try sending a message now. You should be **prompted for a password** as follows:

Please type your tedata e-mail's password, and **check** the box that says **Use Password Manager to remember this password** (unless you prefer to be prompted for a password every single time you send your email). Click **OK** to confirm.

Here's a copy of the warning message you will get when you click OK. Click the **OK** button to close that box.

You should now be able to send out messages.
